

COP 3223H: Introduction to C Programming

Fall 2023

University of
Central Florida

Dr. Kevin Moran

Week 2- Class 1: Executable Statements

- Eustis assignment has been posted
 - Due on Sunday (Sept 3rd)
- Syllabus Quiz has been posted to Webcourses
 - Due on Friday (Sept 3rd) - should only take a few mins

Today's Agenda

1. Discuss Executable Statements
2. Demo and Activity for Connecting to Eustis

Executable Statements

Assignment Statements

- Assignment statements stores a value or a computational result in a variable and is used to perform most arithmetic operations in a program.
- = is called the assignment operator

```
int var;  
var = 32;
```

- Syntax:
 - `variable = expression;`

Compound Assignment Statements

- In C, you can create *compound assignment statements* in the form of:

```
sum = sum + var;
```

Yes! You are seeing double! Let's take a look at what is happening in a statement like this!

Compound Assignment Statements

Python Tutor code visualizer: Visualize code in Python, JavaScript, C, C++, and Java

Python Tutor: Visualize code in [Python](#), [JavaScript](#), [C](#), [C++](#), and [Java](#)

C (gcc 9.3, C17 + GNU extensions)
[known limitations](#)

```
1 int main() {
2
3 int sum = 0;
4 int var;
5
6 var = 2;
7
8 sum = sum + var;
9 sum = sum + var;
10 sum = sum + var;
11
12 return 0;
13 }
```

[Edit this code](#)

→ line that just executed
→ next line to execute

Stack Heap

```
main
  0xFFFF00BD8
  int
  ?
sum  0x????????
     0xFFFF00BD8: 0x?? ????????
     0xFFFF00BD9: 0x?? ????????
     0xFFFF00BDA: 0x?? ????????
     0xFFFF00BDB: 0x?? ????????
var  0x????????
     0xFFFF00BDC: 0x?? ????????
     0xFFFF00BDD: 0x?? ????????
     0xFFFF00BDE: 0x?? ????????
     0xFFFF00BDF: 0x?? ????????
```

Note: ? refers to an uninitialized value

C/C++ [details:](#)

Step 1 of 6

Input/Output Operations and Functions

- Input operation is an instruction that copies data from an input device into memory. (Ex. Keyboard)
- Output operation is an instruction that displays information stored in memory.
- Input/Output functions are C functions that performs an input and output operation (comes from the `stdio.h`)
 - `printf()` //display to screen
 - `scanf()` //collect input

Printing Variables

- In order to print a variable value, we must instruct the printf function on how to do this:
 - 1. Specify the format of the variable
 - 2. The variable name to print

```
printf("The final values are %d and %lf \n",var,y);
```

Printing Variables

Format Specifier	Data Type	description	Syntax
%d	int	To print the integer value	<code>printf("%d",<int_variable>);</code>
%f	float	To print the floating number	<code>printf("%f",<float_variable>);</code>
%lf	double	To print the double precision floating number or long float	<code>printf("%lf",<double_variable>);</code>
%c	char	To print the character value	<code>printf("%c",<char_variable>);</code>

Printing Variables

C (gcc 9.3, C17 + GNU extensions)
[known limitations](#)

```
→ 1 int main() {
   2
   3 int num = 1;
   4 int var = 2;
   5 int val = 3;
   6
   7 printf("%d %d %d\n", num, var, val);
   8 printf("%d %d %d\n", var, val, num);
   9 printf("%d %d %d\n", val, var, num);
  10
  11 return 0;
  12 }
```

[Edit this code](#)

→ line that just executed
→ next line to execute

Stack Heap

main	
num	int ?
var	int ?
val	int ?

Note: ? refers to an uninitialized value

C/C++ [details:](#) none [default view]

Step 1 of 8

Compiler warnings:

Printing Special Characters

Escape Sequence	Meaning
<code>\a</code>	Alert
<code>\b</code>	Backspace
<code>\n</code>	Newline
<code>\t</code>	Horizontal Tab
<code>\v</code>	Vertical Tab
<code>\\</code>	Backslash
<code>\'</code>	Single Quote
<code>\"</code>	Double Quote
<code>\?</code>	Question Mark
<code>%%</code>	Percent Symbol

Accepting User Input with `scanf()`

- Copies data into a variable stored in memory
- Collects user input through the keyboard and stores the value into the respective address of the variable in memory

```
scanf("%d", &var);
```

function name

placeholder with
data type delimiter

reference to
memory address
of the var variable

Example scanf()

```
// Header file for input output functions
#include <stdio.h>

// main function -
// where the execution of program begins
int main()
{

    int num;
    int var;
    int val;
    printf("Enter 3 values");

    scanf("%d", &num);
    scanf("%d", &var);
    scanf("%d", &val);

    printf("%d, %d, %d", num, var, val);

    return 0;
}
```

Example scanf()

```
// Header file for input output functions
#include <stdio.h>

// main function -
// where the execution of program begins
int main()
{

    int num;
    int var;
    int val;
    printf("Enter 3 values");

    scanf("%d%d%d", &num, &var, &val);

    printf("%d, %d, %d", num, var, val);

        return 0;
}
```

Accepting User Input with `scanf()`

- When collecting any type of information from the user, there are 2 important details to consider.
 1. **Data Type:** Each data type (int, double, float, and char) has different size requirements. The placeholder specification allows C to properly store the specific value in memory.
 2. **Memory Location (Address):** Each data value needs to be properly stored somewhere in memory. The `scanf` function requires the programmer to specify the EXACT location in memory of where to store the value.

Return Statements

- Return terminates the function and transfers control from a function back to the activator of the function. For the main function, the control is transferred back to the operating system.
- A value is sent back to the operating system.
 - 0 means code executed successfully
 - 1 means code executed with run time error (code crash).

```
return 0; // function terminator
```

Constant Macro

- A name that is replaced by a particular constant value before program is sent to compiler
- Always seen at the top of a program file.
- Syntax:

```
#define MILES PER KM 0.62137
```

- You are probably thinking that macro constants and constant variables are the same.
- THEY ARE NOT!!!!!!
- **Constant Variables**
 - The keyword `const` is handled by the compiler
- **Macro Constant**
 - The macro is handled by the preprocessor directive. It replaces the text in the C source file.
